## Fourth Semester B.E. Degree Examination Subject Title: Signal Processing

TIME: 03 Hours

Max. Marks: 100

Note: 01. 02. Answer any **FIVE** full questions, choosing at least **ONE** question from each **MODULE**.

| Module -1       |   |                                                                                                                                                                                                                                                                                                                             | *Bloom's<br>Taxonomy<br>Level | CO's | Marks |
|-----------------|---|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|------|-------|
| Q.01            | a | With the help of neat block diagram explain the basic elements of digital signal processing system                                                                                                                                                                                                                          | L2                            | CO1  | 10    |
|                 | b | Explain the classification of signals with examples                                                                                                                                                                                                                                                                         | L2                            | CO1  | 10    |
| OR              |   |                                                                                                                                                                                                                                                                                                                             |                               |      |       |
| Q.02            | a | Explain the concept of frequency in continuous time discrete time signals                                                                                                                                                                                                                                                   | L2                            | CO1  | 10    |
|                 | b | Explain with neat diagram analog to digital Conversion process. Also discuss the importance of sampling of analog signal                                                                                                                                                                                                    | L2                            | CO1  | 10    |
| <b>Module-2</b> |   |                                                                                                                                                                                                                                                                                                                             |                               |      |       |
| Q. 03           | a | Explain the block diagram representation of discrete time system and determine the response of the system for the following input signal<br>$x(n) = \begin{cases}  n  & -3 \leq n \leq 3 \\ 0 & \text{otherwise} \end{cases}$<br>i) $y(n) = \frac{1}{3}[x(n+1) + x(n) + x(n-1)]$<br>ii) $y(n) = \max[x(n+1), x(n), x(n-1)]$ | L2                            | CO2  | 10    |
|                 | b | Explain the resolution of the discrete time signal in to impulses. Determine the response of the system to the input signal $x(n) = \{1,2,3,1\}$ for the impulse response of the system $h(n) = \{1,2,1,-1\}$                                                                                                               | L3                            | CO2  | 10    |
| OR              |   |                                                                                                                                                                                                                                                                                                                             |                               |      |       |
| Q.04            | a | Explain the classification of discrete time systems with example and determine if the systems described by the following input-output equations are linear or nonlinear.<br>i) $y(n) = nx(n)$<br>ii) $y(n) = Ax(n) + B$                                                                                                     | L3                            | CO2  | 10    |
|                 | b | Explain the Properties of Convolution Sum and Interconnection of LTI systems with example                                                                                                                                                                                                                                   | L3                            | CO2  | 10    |
| <b>Module-3</b> |   |                                                                                                                                                                                                                                                                                                                             |                               |      |       |
| Q. 05           | a | What is z transform explain its properties with example                                                                                                                                                                                                                                                                     | L3                            | CO3  | 10    |
|                 | b | Determine the z-transform of the signals<br>(a) $x(n) = (\cos \omega_0 n)u(n)$<br>(b) $x(n) = (\sin \omega_0 n)u(n)$                                                                                                                                                                                                        | L3                            | CO3  | 10    |
| OR              |   |                                                                                                                                                                                                                                                                                                                             |                               |      |       |
| Q. 06           | a | Explain inverse z transform by partial fraction expansion with example                                                                                                                                                                                                                                                      | L2                            | CO3  | 10    |

|                 |   |                                                                                                                                                                                                                                                                   |    |     |    |
|-----------------|---|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|-----|----|
|                 | b | Determine the inverse z-transform of<br>$X(Z) = \frac{1}{1-1.5z^{-1}+0.5z^{-2}}$ for i) ROC: $ z  > 1$<br>ii) ROC: $ z  < 0.5$                                                                                                                                    | L2 | CO3 | 10 |
| <b>Module-4</b> |   |                                                                                                                                                                                                                                                                   |    |     |    |
| Q. 07           | a | What is FIR filters and explain the Characteristics of Practical Frequency-Selective Filters                                                                                                                                                                      | L3 | CO4 | 10 |
|                 | b | Determine the coefficients of a linear-phase FIR filter of length $M=15$ which has asymmetric unit sample response and a frequency response that satisfies the conditions<br>$H_r(n) = \begin{cases} 1 & k = 0,1,2,3 \\ 0.4 & k = 4 \\ 0 & k = 5,6,7 \end{cases}$ | L3 | CO4 | 10 |
| OR              |   |                                                                                                                                                                                                                                                                   |    |     |    |
| Q. 08           | a | Explain Design of FIR differentiators with necessary equations                                                                                                                                                                                                    | L3 | CO4 | 10 |
|                 | b | Design a bandpass filter of length $M = 32$ with passband edge frequencies $f_{p1} = 0.2$ and $f_{p2} = 0.35$ and stopband edge frequencies of $f_{s1} = 0.1$ and $f_{s2} = 0.425$ .                                                                              | L3 | CO4 | 10 |
| <b>Module-5</b> |   |                                                                                                                                                                                                                                                                   |    |     |    |
| Q. 09           | a | Explain steps involved in designing IIR filter using bilinear transformation                                                                                                                                                                                      | L3 | CO4 | 10 |
|                 | b | Convert the analog filter with system function<br>$H(S) = \frac{s + 0.1}{(S + 0.1)^2 + 16}$ into a digital IIR filter by means of the bilinear transformation. The digital filter is to have a resonant frequency of $\omega_r = \pi/2$                           | L3 | CO4 | 10 |
| OR              |   |                                                                                                                                                                                                                                                                   |    |     |    |
| Q. 10           | a | Explain the characteristics commonly used Analog filters with necessary equations                                                                                                                                                                                 | L3 | CO4 | 10 |
|                 | b | Determine the order and the poles of a type I lowpass Chebyshev filter that has a 1-dB ripple in the passband, a cutoff frequency $\Omega_p = 1000\pi$ , a stopband frequency of $2000\pi$ , and an attenuation of 40 dB or more for $\Omega \geq \Omega_s$ .     | L3 | CO4 | 10 |

\*Bloom's Taxonomy Level: Indicate as L1, L2, L3, L4, etc. It is also desirable to indicate the COs and POs to be attained by every bit of questions.
